Lobsters: replay and repeat-check status

October 24, 2026, 07:33 IST. Hard stop09:46:01 IST. Serial table uses saboteur **0.12.3**, source `6f87ccc98377bf0c23f3cf409006f0464c2aa67c`, explicit **jobs=1**, Ruby4.0.0 for PR trees. Repeat/parallel stages below use the same version/source/Ruby and EX-1; jobs is stated per stage. EX-1 on every replay: exclude `spec/features/user_administration_spec.rb` through `rspec_args`, field only, no app spec edits. Reason: banning-email test independently red at40753644, untouched by selected PRs; issue #2263 relation unverified.

PR	Mutants	Killed / survived	Timeouts / errors	Tool score*	Wall / exit	Peak child RSS
#2231	4	4 / 0	0 / 0	100%	35.85s / 0	433,048KiB
#2204	22	19 / 3	0 / 0	86.4%	62.65s / 1	391,532KiB
#2156	7	6 / 1	0 / 0	85.7%	25.54s / 1	353,436KiB
#2090	7	7 / 0	0 / 0	100%	45.90s / 0	407,052KiB
#2182	0	0 / 0	0 / 0	N/A	10.73s / 0	338,344KiB

*SELECTED-SPEC FLOW ONLY, not the requested full CI whole-map flow. PR trees did not restore a whole-suite map; survivor logs explicitly say “survivors unconfirmed”. These are tool scores, not independent quality verdicts. Four nonzero replays total40 mutants:36 killed,4 survived. #2182 completed with no changed mutation subject and no mutants; this is not mutation coverage or a fifth nonzero replay. Its fake-kill check is not applicable.

Stage / gate	Status and limits
Fake-kill gate	All5 serial reports plus parallel/repeat/determinism reports inspected. Every killedBy reference resolves; no credit to the excluded file, no excluded testFiles, rejectedKills0. Four nonzero reports checked; zero-mutant report has no kills to validate.
Kill / survivor meaning	Tool labels28 assertion kills and8 crash kills; all4 #2231 kills are crashes. Four survivors are candidates, not confirmed real gaps. Fresh independent classification/killing specs and seeded10-kill cause checks ongoing, not complete.
Map	Built749subjects/908tests; three908/0 pass logs. Extra whole-app command truncated117/11,984, exit130, no aggregate score. Contended. Original502.41s vs timestamp-derived1,213.27s retained separately; cache239.47s is an unverified clock value. Cause OPEN.
Parallel	#2204 jobs2:31.72s, RSS377,876KiB, exit1; repeat32.49s, RSS392,576KiB, exit1. All22 IDs/status/killedBy match serial, zero diffs. Producer trace observed worker2 primary/cache/queue/rack_attack SQLite copies at07:29:48, gone after completion. This supports copy creation/cleanup, not proof of no cross-contamination.
Determinism	Two jobs1 repeats:33.24s/RSS392,648KiB and33.83s/RSS392,680KiB, both exit1. Three serial runs:22 IDs, zero status/killedBy diffs. JSON has no gap field (N/A); text survivor blocks match: boundary label, same3 digests/hints. Runtime variation is not a verdict difference.
Uncontended map	New map attempt3 running since07:31:42 per producer; no result received. Previous map timing discrepancy remains unresolved.
Setup / safety	Literal install was idempotent, not fresh-flow proof. Earlier #2231 setup failed without database.yml, then used copied pin configuration. Landlock ABI2 fallback and debugger/profiler-at-fork warnings remain. Each replay’s immutable raw measurement retained; status/path enrichment must be separate.
